"Physical computing" ?

Physical computing

From Wikipedia, the free encyclopedia

- *Have questions?*

[Find out how to ask questions and get answers.](#) •Jump to: [navigation](#), [search](#)

Physical computing, in the broadest sense, means building interactive [physical systems](#) by the use of [software](#) and [hardware](#) that can sense and respond to the [analog](#) world. While this definition is broad enough to encompass things such as smart automotive traffic [control systems](#) or factory [automation processes](#), it is not commonly used to describe them. In the broad sense, physical computing is a creative framework for understanding [human beings](#)' relationship to the [digital](#) world. In practical use, the term most often describes handmade [art](#), design or [DIY](#) hobby projects that use [sensors](#) and [microcontrollers](#) to translate analog input to a [software system](#), and/or control [electro-mechanical](#) devices such as [motors](#), [servos](#), [lighting](#) or other hardware.

INTRODUCTION

In the last decade, various movements embraced human-computer interface designs that include physical user interfaces augmented by computing power. These include *ubiquitous computing* and *calm technology* [15], *pervasive computing* [1], *tangible user interfaces* [7], *information appliances* [12] and *context-aware computing* [3].

Researchers in these areas have demonstrated many simple but exciting examples of physical user interfaces. Ishii and

Physical Computing is an approach to learning how humans communicate through computers that starts by considering how humans express themselves physically. In this course, we take the human body as a given, and attempt to design computing applications within the limits of its expression.

Les interfaces tangibles

Tangible Bits is our vision of Human Computer Interaction (HCI) which guides our research in the Tangible Media Group. People have developed sophisticated skills for sensing and manipulating our physical environments. However, most of these skills are not employed by traditional GUI (Graphical User Interface). Tangible Bits seeks to build upon these skills by giving physical form to digital information, seamlessly coupling the dual worlds of bits and atoms.

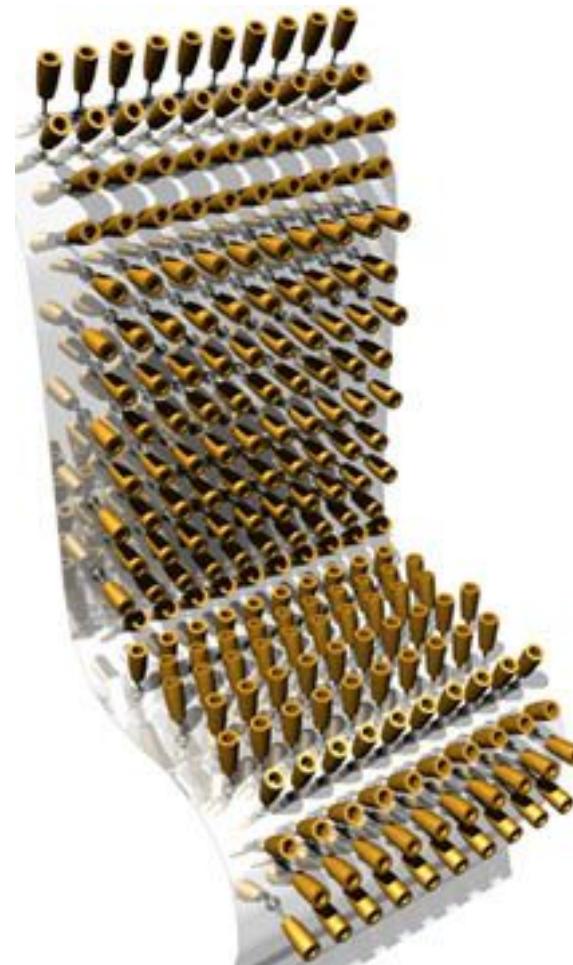

Guided by the Tangible Bits vision, we are designing "tangible user interfaces" which employ physical objects, surfaces, and spaces as tangible embodiments of digital information. These include foreground interactions with graspable objects and augmented surfaces, exploiting the human senses of touch and kinesthesia. We are also exploring background information displays which use "ambient media" -- ambient light, sound, airflow, and water movement. Here, we seek to communicate digitally-mediated senses of activity and presence at the periphery of human awareness. The goal is to change the "painted bits" of GUIs (Graphical User Interfaces) to "tangible bits," taking advantage of the richness of multimodal human senses and skills developed through our lifetime of interaction with the physical world.

Virtual Visiting

[Sign up here to receive regular updates on iRobot ConnectR.](#)

iRobot® ConnectR™ Virtual Visiting Robot

Stay close to those you love – no matter where you are!

Don't miss out on special moments at home even when you are away. The iRobot ConnectR is a fun new way to see, talk to and interact with your loved ones, friends and pets – when you can't be there in person. Combining the latest in Internet communications and robot technology, ConnectR lets you virtually visit with loved ones, relatives and pets anytime you wish – seeing, hearing and interacting with them in their home as if you were there in person.

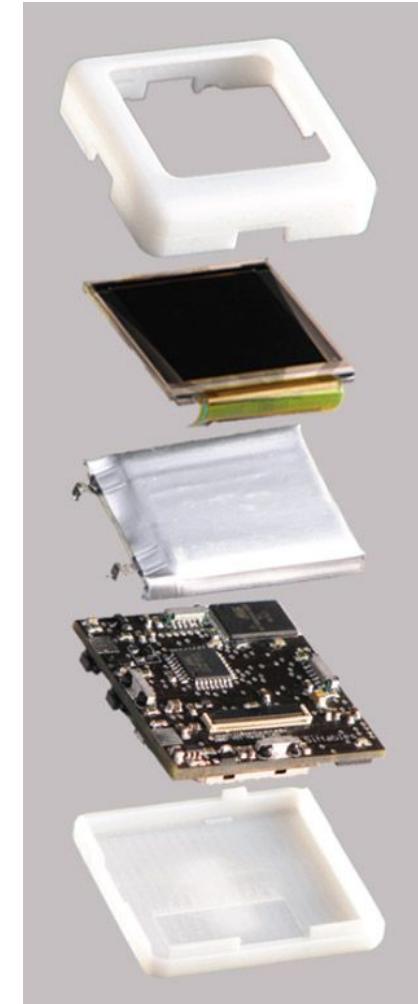

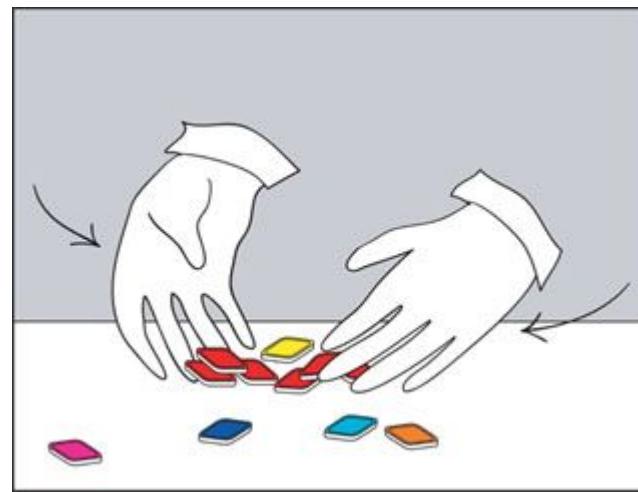

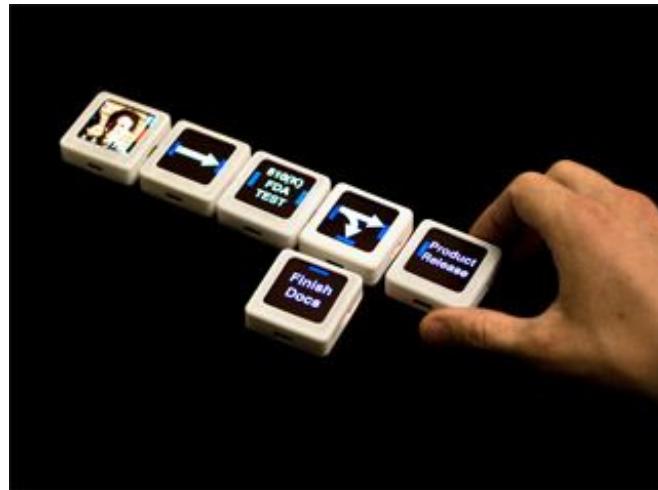

- Participate in family moments even though you're working late
- On a business trip? Read your kids a story and see their faces light up
- Join the fun from near or far
- Throw a party from a thousand miles away
- Tell Fido he's a "good boy" even while you're on vacation

The Nabaztag website features a navigation bar with links like "ACHETER UN LAPIN", "J'AI UN NOUVEAU LAPIN", "MON AMI(E) A UN LAPIN", and "J'AI DEJA UN LAPIN". Below the navigation are sections for "COMMENT ÇA MARCHE?", "QUE SAIT-IL FAIRE?", and "SCÈNES DE LA VIE QUOTIDIENNE". A red button on the right says "ADOPEZ UN LAPIN". The main content area shows three white rabbit figurines on blue, orange, and green backgrounds with text overlays: "IL PARLE" and "IL BOUGE".

3D Robotics Sifteo Cubes Sifteo Support FAQ Contact

So long, thank you, we're still here

We'll cut to the chase: Sifteo has been acquired by [3D Robotics](#)! We're really excited about it; we will continue to support Sifteo Cubes and Sifteo users; and we are so grateful to our customers and supporters around the world. *Thank you.*

handbuilt prototypes from our MIT days

When we (Dave and Jeevan) started Sifteo in 2009, we knew we could deliver magical versions of everyday objects - that we could use the latest in computing and sensors to create new interactions that were more natural, more human, and just better than what currently existed.

C. Verplaetse IBM Systems Journal 35(3-4) 1996 !!

Inertial proprioceptive devices: Self-motion-sensing toys and tools

by C. Verplaetse

Utilisation de l'accéléromètre

On pose la wiimote de manière à avoir successivement les trois axes X Y Z à la verticale et on collecte les valeurs renvoyées.

$$+Z : x_1, y_1, z_1$$

$$+Y : x_2, y_2, z_2$$

$$+X : x_3, y_3, z_3$$

d'où les coordonnées du point origine:

$$x_0 = (x_1 + x_2) / 2$$

$$y_0 = (y_1 + y_3) / 2$$

$$z_0 = (z_2 + z_3) / 2$$

On obtient alors les coordonnées du vecteur force (exprimées en g) :

$$ax = (x_{\text{raw}} - x_0) / (x_3 - x_0)$$

$$ay = (y_{\text{raw}} - y_0) / (y_2 - y_0)$$

$$az = (z_{\text{raw}} - z_0) / (z_1 - z_0)$$

Pour le nunchuk, il est plus difficile de faire cette calibration du fait du facteur forme. L'examen de photos d'amateurs sur le Web permet d'éviter un démontage et suggère que l'accéléromètre est placé sur un plan horizontal lorsque le nunchuck est pris en main comme un pistolet.

Calcul d'orientation pitch et roll :

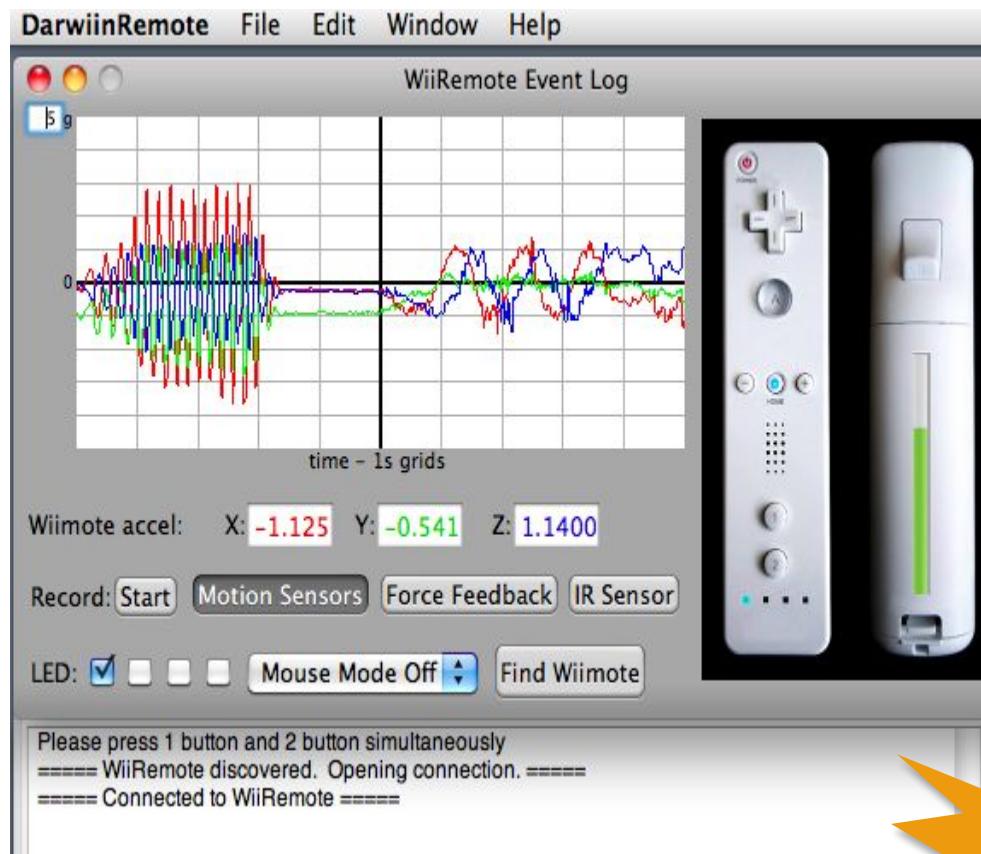

Si la wiimote n'est pas en mouvement accéléré, la mesure des coordonnées du vecteur gravité permet de d'obtenir l'orientation dans l'espace du dispositif en pitch et roll :

$$\text{pitch} = \arctan(ax / \sqrt{ay^2 + az^2})$$
$$\text{roll} = \arctan(ay / \sqrt{ax^2 + az^2})$$

source : Kionix. *Tilt-sensing with Kionix MEMS Accelerometers*. Application note AN005. 2005 (en ligne sur www.kionix.com)

On peut vérifier le repos en s'assurant que la norme $ax^2 + ay^2 + az^2$ est proche de l'unité.

The screenshot shows the Arduino IDE interface with the title bar "Arduino - 0008 Alpha". Below the title bar is a toolbar with various icons. The main area displays the "Blink" sketch. The code is as follows:

```
/*
 * Blink
 *
 * The basic Arduino example. Turns on an LED on for one second,
 * then off for one second, and so on... We use pin 13 because,
 * depending on your Arduino board, it has either a built-in LED
 * or a built-in resistor so that you need only an LED.
 *
 * http://www.arduino.cc/en/Tutorial/Blink
 */
int ledPin = 13; // LED connected to digital pin 13

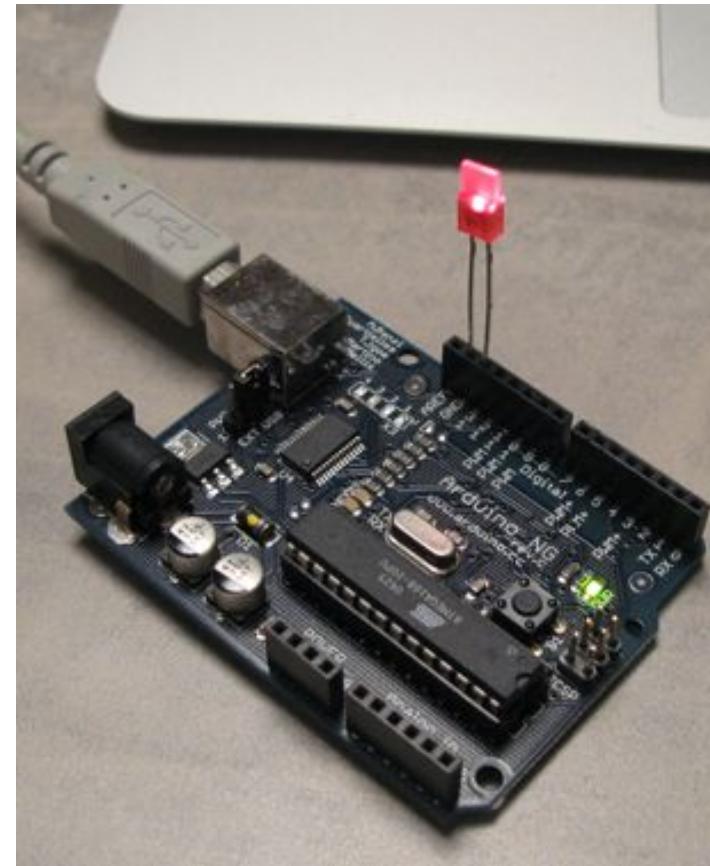

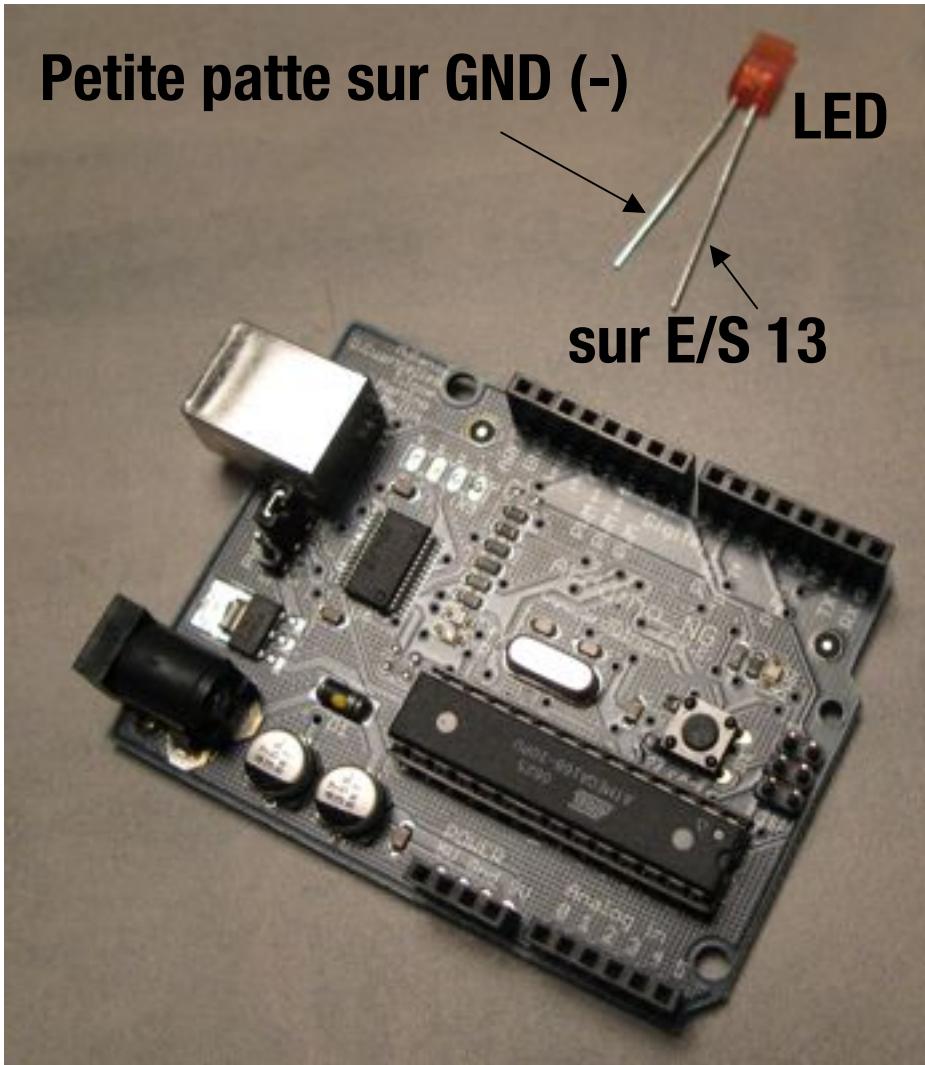

void setup() // run once, when the sketch starts
{
    pinMode(ledPin, OUTPUT); // sets the digital pin as output
}

void loop() // run over and over again
{
    digitalWrite(ledPin, HIGH); // sets the LED on
    delay(1000); // waits for a second
    digitalWrite(ledPin, LOW); // sets the LED off
    delay(1000); // waits for a second
}
```

The bottom half of the IDE window is a black preview area.

 */  
  
int potPin = 0; // select the input pin for the potentiometer  
int speakerPin = 7;  
  
int val = 0;  
  
void setup() {  
    pinMode(speakerPin, OUTPUT);  
}  
  
void loop() {  
    digitalWrite(speakerPin, LOW);  
    val = analogRead(potPin); // read value from the sensor  
    val = val*2; // process the value a little  
    for( int i=0; i<500; i++ ) { // play it for 50 cycles  
        digitalWrite(speakerPin, HIGH);  
        delayMicroseconds(val);  
        digitalWrite(speakerPin, LOW);  
        delayMicroseconds(val);  
    }  
}
```

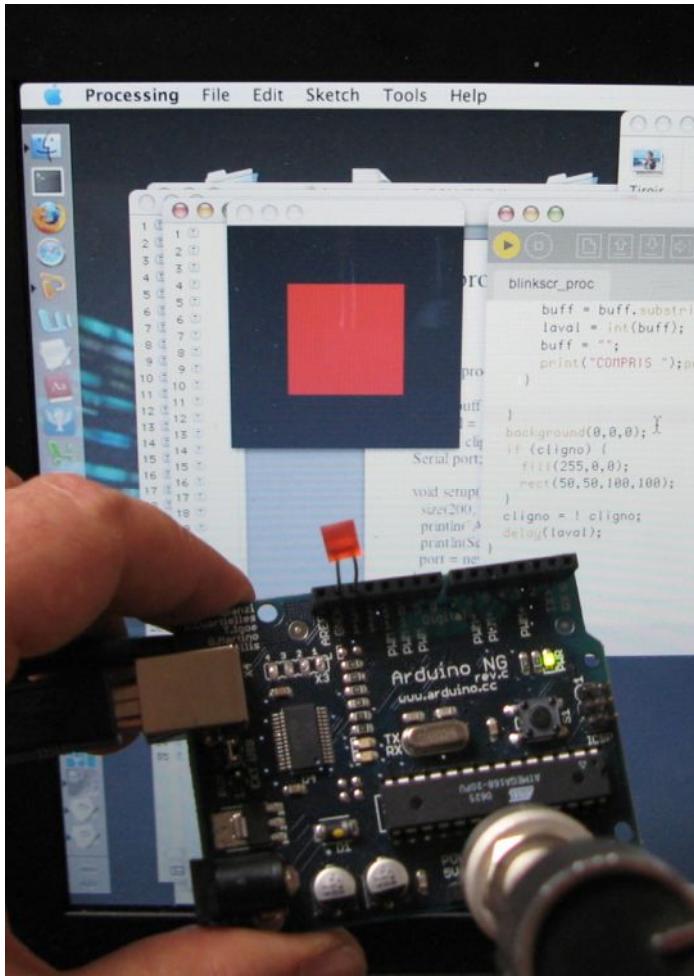

gant de captation (élève ingénieur cnam paris, 2010)

Dialogue avec une application processing (liaison série) : La demo "physical pixel" de exemples->communication

Blink, cette fois sur l'écran (avec processing)

Sur l'arduino =>

```
int potarPin = 0;  
boolean ledState = LOW;  
int laval;
```

```
void setup()  
{  
    Serial.begin(9600);  
    pinMode(13, OUTPUT);  
}
```

```
void loop()  
{  
    laval = analogRead(potarPin);  
    Serial.println(laval);  
    ledState = ! ledState;  
    digitalWrite(13, ledState);  
    delay(laval);  
}
```

sur processing :

```
import processing.serial.*;

String buff = "";
int laval = 100;
boolean cligno = true;
Serial port;

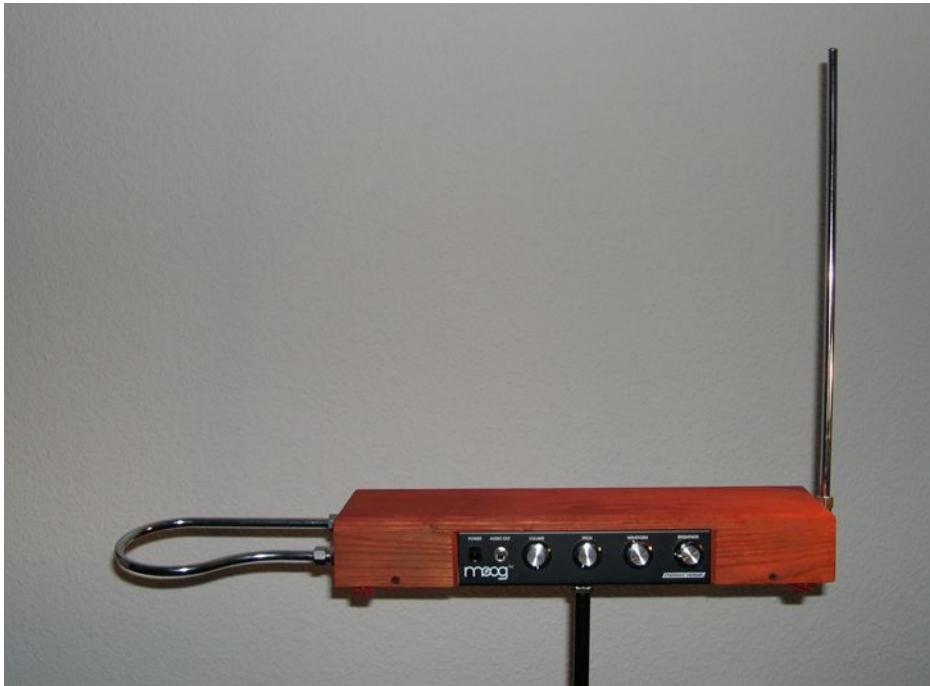

void setup() {
    size(200, 200);
    println("Available serial ports:");
    println(Serial.list());
    port = new Serial(this, "/dev/tty.usbserial-A50018tg", 9600);
}
```

Rque : le println d'Arduino envoie
un CR et LF après laval

Les deux processus synchrones ???

```
void draw() {
    if (port.available() > 0) {
        String buff = port.readStringUntil(13);
        if (buff != null) {
            print("RECU ");println(buff);
            buff = buff.substring(0, buff.length()-1);
            laval = int(buff);
            buff = "";
            print("COMPRIS ");println(laval);
        }
    }
    background(0,0,0);
    if (cligno) {
        fill(255,0,0);
        rect(50,50,100,100);
    }
    cligno = ! cligno;
    delay(laval);
}
```

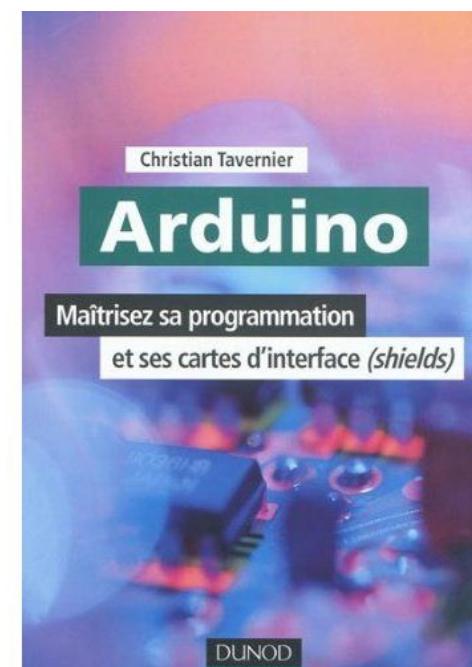

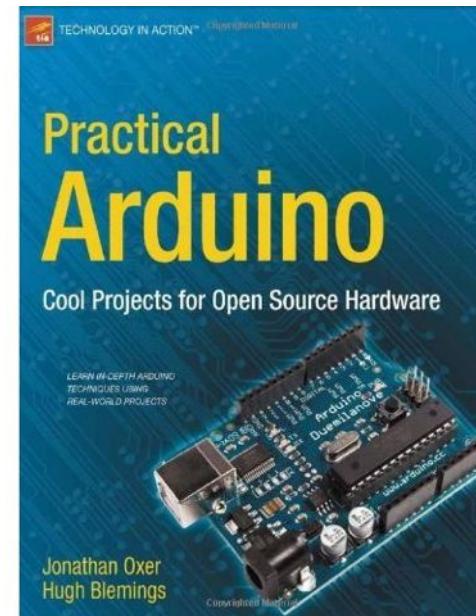

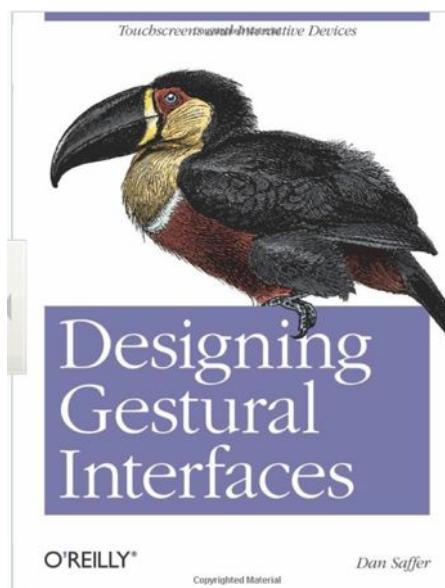

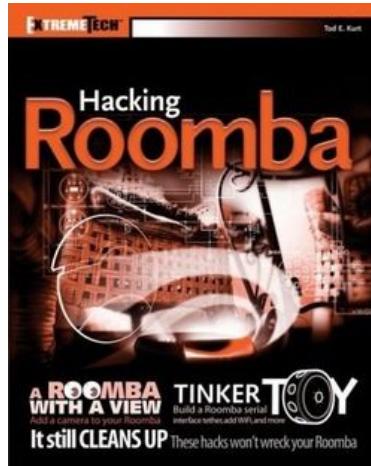

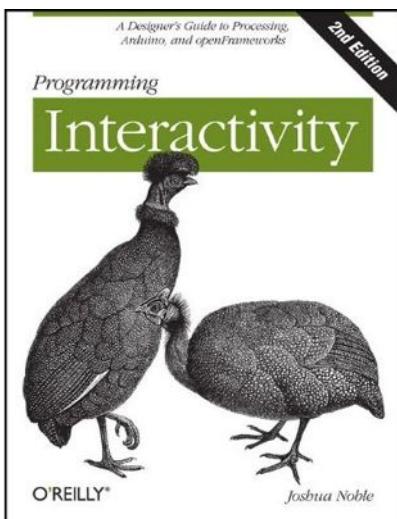

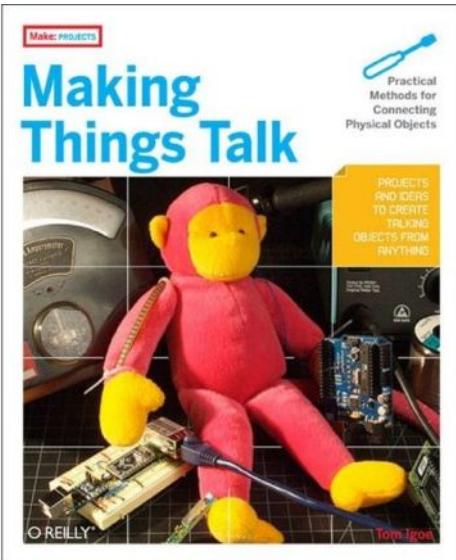

Un bon projet : (re)faire un "Theremin"

The screenshot shows a web browser displaying the homepage of [Physicality.org](http://www.physicality.org/Physicality.org.html). The title bar reads "Physicality.org". The address bar shows the URL "http://www.physicality.org/Physicality.org.html". The top menu bar includes "Lecteur" and "Google". Below the menu, there's a horizontal navigation bar with links: "routeur", "mailcnam", "cedric", "deptinfo", "PrPierre", "Processing", "Divers", "Maisons", and "UTILS". The main content area features a large, hand-drawn style logo "PHYSICALITY.ORG" enclosed in a thick oval border. Below the logo, there are two columns of text and links.

With two and half millennia of philosophical ponderings since Plato and Aristotle, several hundred years of modern science, and perhaps one hundred and fifty years of near modern engineering - surely we know sufficient about the physical for ordinary product design?

While this may be true of the physical properties themselves, it is not the fact for the way people interact with and rely on those properties. It is only when the nature of physicality is perturbed by the unusual and, in particular the digital, that it becomes clear what is and is not central to our understanding of the world.

Increasingly, digital aspects of physical products mean that causal effects are created programmatically rather than mechanically. Sometimes this is because the effect is intrinsically digital or electronic (e.g. TV remote), sometimes because this is cheaper, or more reliable than physical controls (e.g. washing machine control panel), and sometimes because of the increased flexibility of power gained (e.g. central heating control allowing arbitrary complex heating programs).
