Physical computing, in the broadest sense, means building interactive [physical systems](#) by the use of [software](#) and [hardware](#) that can sense and respond to the [analog](#) world. While this definition is broad enough to encompass things such as smart automotive traffic [control systems](#) or factory [automation processes](#), it is not commonly used to describe them. In the broad sense, physical computing is a creative framework for understanding [human beings'](#) relationship to the [digital](#) world. In practical use, the term most often describes handmade [art](#), design or [DIY](#) hobby projects that use [sensors](#) and [microcontrollers](#) to translate analog input to a [software system](#), and/or control [electro-mechanical](#) devices such as [motors](#), [servos](#), [lighting](#) or other hardware.

INTRODUCTION

(Greenberg, UIST'01)

In the last decade, various movements embraced human-computer interface designs that include physical user interfaces augmented by computing power. These include *ubiquitous computing* and *calm technology* [15], *pervasive computing* [1], *tangible user interfaces* [7], *information appliances* [12] and *context-aware computing* [3].

Researchers in these areas have demonstrated many simple but exciting examples of physical user interfaces. Ishii and

Physical Computing is an approach to learning how humans communicate through computers that starts by considering how humans express themselves physically. In this course, we take the human body as a given, and attempt to design computing applications within the limits of its expression.

Les interfaces tangibles

Tangible Bits is our vision of Human Computer Interaction (HCI) which guides our research in the Tangible Media Group. People have developed sophisticated skills for sensing and manipulating our physical environments. However, most of these skills are not employed by traditional GUI (Graphical User Interface). Tangible Bits seeks to build upon these skills by giving physical form to digital information, seamlessly coupling the dual worlds of bits and atoms.

Guided by the Tangible Bits vision, we are designing "tangible user interfaces" which employ physical objects, surfaces, and spaces as tangible embodiments of digital information. These include foreground interactions with graspable objects and augmented surfaces, exploiting the human senses of touch and kinesthesia. We are also exploring background information displays which use "ambient media" – ambient light, sound, airflow, and water movement. Here, we seek to communicate digitally-mediated senses of activity and presence at the periphery of human awareness. The goal is to change the "painted bits" of GUIs (Graphical User Interfaces) to "tangible bits," taking advantage of the richness of multimodal human senses and skills developed through our lifetime of interaction with the physical world.

iRobot® ConnectR™ Virtual Visiting Robot

Stay close to those you love – no matter where you are!

Don't miss out on special moments at home even when you are away. The iRobot ConnectR is a fun new way to see, talk to and interact with your loved ones, friends and pets – when you can't be there in person. Combining the latest in Internet communications and robot technology, ConnectR lets you virtually visit with loved ones, relatives and pets anytime you wish – seeing, hearing and interacting with them in their home as if you were there in person.

- Participate in family moments even though you're working late
- On a business trip? Read your kids a story and see their faces light up
- Join the fun from near or far
- Throw a party from a thousand miles away
- Tell Fido he's a "good boy" even while you're on vacation

Inertial proprioceptive devices: Self-motion-sensing toys and tools

by C. Verplaetse

Utilisation de l'accéléromètre

On pose la wiimote de manière à avoir successivement les trois axes X Y Z à la verticale et on collecte les valeurs renvoyées.

+Z : x1, y1, z1

+Y : x2, y2, z2

+X : x3, y3, z3

d'où les coordonnées du point origine:

$$x0 = (x1 + x2)/2$$

$$y0 = (y1 + y3)/2$$

$$z0 = (z2 + z3) / 2$$

On obtient alors les coordonnées du vecteur force (exprimées en g) :

$$ax = (xraw - x0)/(x3 - x0)$$

$$ay = (yraw - y0)/(y2 - y0)$$

$$az = (zraw - z0)/(z1 - z0)$$

Pour le nunchuk, il est plus difficile de faire cette calibration du fait du facteur forme. L'examen de photos d'amateurs sur le Web permet d'éviter un démontage et suggère que l'accéléromètre est placé sur un plan horizontal lorsque le nunchuck est pris en main comme un pistolet.

Calcul d'orientation pitch et roll :

Si la wiimote n'est pas en mouvement accéléré, la mesure des coordonnées du vecteur gravité permet de d'obtenir l'orientation dans l'espace du dispositif en pitch et roll :

$$\text{pitch} = \arctan(ax / \sqrt{ay*ay + az*az})$$

$$\text{roll} = \arctan(ay / \sqrt{ax*ax + az*az})$$

source : Kionix. *Tilt-sensing with Kionix MEMS Accelerometers*. Application note AN005. 2005 (en ligne sur www.kionix.com)

On peut vérifier le repos en s'assurant que la norme $ax*ax + ay*ay + az*az$ est proche de l'unité.

Le filtrage : de la moyenne mobile au filtre de Kalman

Dans le cas où il s'agit d'estimer une seule valeur constante subissant un bruit blanc constant de mesure (moyenne nulle, écart type R), l'itération du filtre de Kalman s'écrit en notant :

$X(n)$ le processus étudié (dans notre exemple, l'angle de pitch ou de roll)

$Z(n)$ la n -ième mesure : $Z(n) = X(n) + V$ avec V suivant une loi normale $N(0, R)$

$x(n)$ la n -ième valeur de l'estimateur du processus étudié

$K := 1/(1+R)$; $x := 0$

répéter

 acquérir la mesure Z

$x := (1-K)*x + K*Z$

$K := K/(K+1)$

 utiliser l'estimateur x

jusqu'à fin des mesures

On remarque que le cas $R=0$ correspond pour x à un calcul de moyenne des $Z(i)$ $i=1..n$

Si le processus n'est pas constant et évolue de manière aléatoire : $X(n) = X(n-1) + W$ avec W suivant une loi normale $N(0, Q)$, on a :

$P := 1$; $x := 0$;

répéter

 acquérir la mesure Z

$K = (P+Q)/(P+Q+R)$;

$x = (1-K)*x + K*Z$;

$P = (1-K)*(P+Q)$;

 utiliser l'estimateur x

jusqu'à fin des mesures

Nous avons utilisé cette dernière procédure pour l'estimation de l'angle de pitch de la wiimote. Avec $R = 0.1$ et $Q = 0.0001$, on obtient une estimation de l'angle avec une précision d'un degré, comparable à celle d'un clinomètre de randonnée, au prix d'un temps de stabilisation assez long, de l'ordre de quelques secondes.

Un exemple d'utilisation avec Processing

Ma lunette Takahashi

Accéder à la wiimote
sur mac : JarwinRemote

(production d'un fichier txt :-()

le code

```
void draw(){

//saisie des infos + calculs
wiimote_file = loadStrings("/wiimote.txt");
if (wiimote_file.length == 1) {
  wiimote_values = wiimote_file[0].split(";");
  accX = Integer.parseInt(wiimote_values[0]);
  accY = Integer.parseInt(wiimote_values[1]);
  accZ = Integer.parseInt(wiimote_values[2]);
}
ax = (accX - 130.0)/26.0;
ay = (accY - 129.5)/27.0;
az = (accZ - 127.5)/24.0;
//pitch = atan2(sqrt(ay*ay+az*az),ax)*180/PI;
roll = atan2(sqrt(ax*ax+az*az),ay);
roll += PI/180; //pour ameliorer le calibrage

// filtrage Kalman
K = (P+Q)/(P+Q+R);
xhat = xhat*(1.0-K)+K*roll;
P = (1.0-K)*(P+Q);
```

```
background(0);
// dessine la lunette normale
translate(width/2,height/2);
rotate(PI/2-roll);
stroke(250);
line(-width/2,0,width/2,0);
resetMatrix();

// dessine la lunette Kalman
translate(width/2,height/2);
rotate(PI/2-xhat);
stroke(204, 102, 0);
line(-width/2,0,width/2,0);
resetMatrix();

// rajoute une mire
stroke(0);
for (int i=0; i<=90; i = i+ 15){
  translate(width/2,height/2);
  rotate(-i*PI/180.0);
  line(-width/2,0,width/2,0);
  resetMatrix();
}
noStroke();
delay(100);
}
```

Très nombreuses autres applications / détournements...

3] La carte ARDUINO

www.arduino.cc

+ une version
bluetooth

En France : AlyaSoft (à Bézier) : 22 euros

Le μ contrôleurs ATMega de ATMEL:

Risc 24 MIPS / 24 MHz horloge
131 instructions, 32*8 registres
16 Ko FLASH + 1 Ko SRAM
+ 512b EEPROM

La carte ARDUINO reprend toutes ses E/S :

- 6 E. analogiques 10bits
- 6 E/S numériques (PWM)
- port série
- + alim
- + port usb vers l'hôte

L'environnement Arduino

Multiplateforme !
Open source !

Basé sur C/C++

Types flottants !!
fcts math
tableaux

Librairies de com
Serie, i2c (Wire)

Contrôle servos ...

```
/*  
 * Blink  
 *  
 * The basic Arduino example. Turns on an LED on for one second,  
 * then off for one second, and so on... We use pin 13 because,  
 * depending on your Arduino board, it has either a built-in LED  
 * or a built-in resistor so that you need only an LED.  
 *  
 * http://www.arduino.cc/en/Tutorial/Blink  
 */  
  
int ledPin = 13;           // LED connected to digital pin 13  
  
void setup()               // run once, when the sketch starts  
{  
  pinMode(ledPin, OUTPUT); // sets the digital pin as output  
}  
  
void loop()                // run over and over again  
{  
  digitalWrite(ledPin, HIGH); // sets the LED on  
  delay(1000);                // waits for a second  
  digitalWrite(ledPin, LOW);  // sets the LED off  
  delay(1000);                // waits for a second  
}
```

« blink » : le Hello world de l'Arduino

Buzzer :

```
/* copleyleft 2006 Tod E. Kurt <tod@todbot.com  
* http://todbot.com/  
*/
```

```
int potPin = 0;  // select the input pin for the potentiometer  
int speakerPin = 7;
```

```
int val = 0;
```

```
void setup() {  
  pinMode(speakerPin, OUTPUT);  
}
```

```
void loop() {  
  digitalWrite(speakerPin, LOW);  
  val = analogRead(potPin);  // read value from the sensor  
  val = val*2;                // process the value a little  
  for( int i=0; i<500; i++ ) { // play it for 50 cycles  
    digitalWrite(speakerPin, HIGH);  
    delayMicroseconds(val);  
    digitalWrite(speakerPin, LOW);  
    delayMicroseconds(val);  
  }  
}
```

Blink, cette fois sur l'écran (avec processing)

Sur l'arduino =>

```
int potarPin = 0;  
boolean ledState = LOW;  
int laval;
```

```
void setup()  
{  
  Serial.begin(9600);  
  pinMode(13, OUTPUT);  
}
```

```
void loop()  
{  
  laval = analogRead(potarPin);  
  Serial.println(laval);  
  ledState = ! ledState;  
  digitalWrite(13, ledState);  
  delay(laval);  
}
```

sur processing :

```
import processing.serial.*;

String buff = "";
int laval = 100;
boolean cligno = true;
Serial port;

void setup() {
  size(200, 200);
  println("Available serial ports:");
  println(Serial.list());
  port = new Serial(this, "/dev/tty.usbserial-A50018tg", 9600);
}
```

Rque : le println d'Arduino envoie
un CR et LF après laval

Les deux processus synchrones ???

```
void draw() {
  if (port.available() > 0) {
    String buff = port.readStringUntil(13);
    if (buff != null) {
      print("RECU ");println(buff);
      buff = buff.substring(0, buff.length()-1);
      laval = int(buff);
      buff = "";
      print("COMPRIS ");println(laval);
    }
  }
  background(0,0,0);
  if (cligno) {
    fill(255,0,0);
    rect(50,50,100,100);
  }
  cligno = ! cligno;
  delay(laval);
}
```
